## Abstract

Orchids are prized for their ornamental value in addition to being rich in symbolic meaning. Many of these plants are indigenous to tropical rainforests, but orchids can also grow in temperate areas. Orchids can be terrestrial plants or epiphytes. The latter means that they latch onto other plants as growth supports. Every orchid is a perennial plant, meaning they regrow year after year. Epiphytic species are more common in tropical regions, while terrestrial orchids usually grow in temperate climates.

The person who was interviewed for this study, Mrs. Irangani Nilaweera is a farmer in the ambalantota divisional sector of the Hambantota District. This study is described how to grow orchid plant successfully. Orchids are popular house plants and make a beautiful addition to house plant displays. Most orchids require bright light but indirect sunlight. However some orchids, such as Vanda orchids, require full sun. For moth orchids and others that need bright but indirect light, an east- or west-facing windowsill is perfect. Too much light can scorch the leaves. Fertilizers should be added correctly. Pests and diseases must be avoided.

There's a simple reason why orchids are so popular: they look absolutely stunning. Orchids can create a rainbow of color in your home. It can be developed as small business. There are many benefits in orchid plantation. Orchid Plants Might Help Increase Productivity, Orchids Are Low-Maintenance Plants etc.

Key words; Orchids, ornamental, house plant
