

Abstract

Liquid fertilizers have become an increasingly popular method of providing essential nutrients to crops, as they are easy to apply and can be quickly absorbed by plants. The purpose of making this liquid fertilizer is to get a good crop yield during the last fertilizer shortage. This liquid fertilizer is made using natural ingredients that are easily found in the environment. It has been using several types of crops. As result, it can be used mainly for tea cultivation as well as for other crops. This shows that this low-cost, easy-to-make liquid fertilizer is safe for health and gives good yields. This type of liquid fertilizer should be investigated for further development.
